This book is designed to be easy to follow. I avoid great jumps of thought. Every time a new concept is presented, I explain it immediately or say how much it will explain it. The central concepts are reinforced with exercises and multiple explanations so that you can verify your assumptions and ensure that you follow it. I lead with examples. Instead of writing symbols soup, my goal is to facilitate visualizing these concepts. I also think we learn better to remember something we already know, and examples facilitate memory. So, when you are trying to remember the difference between matrices and linked lists (explained in capitulum 2), you may think about sitting for a movie. In addition, at the risk of declaring the obvious, I am a visual apprentice. This book is full of images. The content of the book is carefully curated. There is no need to write a book that covers all classification algorithms, so we have Wikipedia and Khan Academy. All the algorithms that I have included are practical. I have found them in my work as a software engineer, and provide a good basis for more complex issues. Feliz Reading!
